1 Introduction

1.1 What this system is for

Open Clinical Record helps a clinic run three connected workflows:

1. **Register and find patients**
2. **Book and manage appointments**, including check-in
3. **Document clinical visits** so history accumulates safely over time

It is deliberately focused. It is not a full hospital system (no pharmacy, laboratory orders, or billing modules in this version).

1.2 Who uses it

Role	Typical work
Receptionist	Register patients, book/cancel/reschedule, check-in, mark deceased
Nurse	Support the queue, record vitals and notes on visits
Doctor	Review the chart, document and finalize visits, mark/clear deceased
Administrator	Users and audit; system oversight

Your menu only shows what your role is allowed to use. Even if someone tries a hidden URL, the server still blocks forbidden actions.

2 Getting Started

2.1 Sign in

1. Open the application in a browser (local development: `http://localhost:5173`).
2. Enter your email and password.
3. You arrive on a dashboard tailored to your role.

2.2 Training accounts (development only)

Email	Role	Default password
desk@clinic.local	Receptionist	Dev@12345
nurse@clinic.local	Nurse	Dev@12345
doctor@clinic.local	Doctor	Dev@12345
admin@clinic.local	Admin	Dev@12345

Never use these passwords outside a training or laboratory environment. Change them before any production-like deployment.

2.3 Navigation

The left sidebar is role-aware. Common destinations include Dashboard, Patients, Register patient, Medical Chart, Appointments, New appointment, Check-in / Queue, Profile, and Admin areas (Admin only).

2.4 Patient context

Whenever you work on a chart or appointment, confirm the patient name and medical record number. This reduces wrong-patient mistakes.

3 Receptionist Guide

3.1 Register a patient

1. Open **Register patient**.
2. Prefer searching first so you do not create a duplicate.
3. Enter name, sex, date of birth, and contact details as required.
4. Save. The system assigns a medical record number (for example OCR-000123).

3.2 Book an appointment

1. Open **New appointment**.
2. Search and select the patient.
3. Choose date, duration, and an available time slot.
4. Choose a type (Consultation, Follow-up, New complaint, Procedure, Walk-in, Other).
5. Optionally set provider and reason, then create the appointment.

You cannot book for a patient marked **Deceased**.

3.3 Check-in

1. Open **Check-in / Queue** (or Appointments for the day).
2. Locate the patient.
3. Select **Check in**. Status becomes Checked in and a **Draft visit** is created for clinical staff.

Completed, cancelled, and no-show appointments do not remain in the active queue.

3.4 Cancel an appointment

1. Open the appointment actions.
2. Choose **Cancel**.
3. Enter a **reason** (required).

4. Confirm.

Cancellation keeps history; it does not erase the appointment record.

3.5 Reschedule

Use reschedule when the status allows it (typically Scheduled, Waiting, Cancelled, or No-show). Choose a new date and time. Reschedule is blocked once the patient is already checked in, in progress, or completed.

3.6 Mark deceased

Receptionists may mark a patient deceased when clinic policy requires it, providing the details requested by the form. **Clearing** deceased status is limited to Doctor and Admin.

4 Nurse Guide

4.1 Support the queue

Open Check-in / Queue, identify patients who have arrived, and open the chart from the patient record.

4.2 Record vitals and notes

1. Open the patient chart.
2. Select the active **Draft** visit (created at check-in when applicable).
3. Enter vital signs (blood pressure, pulse, temperature, respiratory rate, SpO₂, and related fields as shown).
4. Add nursing notes if needed.
5. Save. Leave the visit as Draft until the clinician finalizes, unless local policy allows nurses to finalize.

Nurses **cannot** mark a patient deceased.

5 Doctor Guide

5.1 Review the chart

From Patients, open the patient and review allergies, history, and the full **visit history**.

5.2 Document and finalize a visit

1. Open the active Draft visit.
2. Update chief complaint, diagnoses, plan, and vitals as required.
3. When the consultation is complete, set the visit status to **Final**.

Important rules:

- Final visits cannot be edited. For new information later, start a **new** visit.
- Prior visits are never overwritten. History remains longitudinal.
- Finalizing a visit linked to an appointment marks that appointment **Completed** and removes the patient from the active check-in queue.

5.3 Deceased status

Doctors may mark and clear deceased status according to clinic policy.

6 Administrator Guide

- Manage users and roles as provided by the application.
- Review **audit** events for important actions (who did what, and when).
- Administrators are not automatically clinical authors; chart writing remains Doctor and Nurse.

7 Appointment Statuses (Plain Language)

Status	Meaning
Scheduled	Booked; patient has not yet arrived
Waiting	In the waiting area
Checked in	Arrived; Draft visit available for documentation
In progress	Being seen
Completed	Visit finished
Cancelled	Called off; reason recorded
No-show	Did not attend

8 Visit Statuses

Status	Meaning
Draft	Editable clinical documentation
Final	Closed; no further edits to this visit
Cancelled	Visit voided

9 Troubleshooting

Problem	What to try
Blank white page	Hard refresh (Ctrl+Shift+R). Confirm the API is running. Sign out and sign in again.
Permission denied	Your role cannot perform that action. Use the correct account or ask an administrator.
Cannot cancel	Enter a non-empty cancellation reason.
Patient missing from queue	They may already be Completed, Cancelled, or No-show. Adjust filters or date.
Cannot book	Patient may be Deceased, or required fields/slot may be missing.

10 Privacy and Professional Conduct

- Access only the records needed for your task.
- Do not share passwords or leave sessions open on shared computers.
- Use synthetic or de-identified data in screenshots and training materials.
- Sign out when finished.

Document information

User Manual version 1.0 (27 September 2026). For technical architecture and APIs, see the Technical Documentation. For formal requirements, see SRS v2.0.
